Mac OS X

- What we all know and love

- UNIX Based

  At the core of Mac OS X is Darwin, Apple's advanced operating system kernel. Darwin is Linux-like, featuring the same Free BSD Unix support and open-source model. Darwin brings an entirely new foundation to the Mac OS, offering Mac users true memory protection for higher reliability, preemptive multitasking for smoother operation among multiple applications and fully Internet-standard TCP/IP networking. As a result, Mac OS X is the most reliable and robust Apple operating system ever.
